

Stock Squeeze Screener

Quick Overview — what this tool does

What it is

An automated stock screening dashboard that scans roughly 4,000 US-listed stocks every trading day and surfaces the handful that are setting up for a potential breakout: stocks priced under \$2 whose price range has squeezed unusually tight (Bollinger Band squeeze) while an early uptrend forms and trading volume shifts from quiet contraction to fresh expansion — a classic pattern that often precedes a strong move.

How a stock earns a spot on the list

- **Priced under \$2** with a minimum liquidity floor (so it's actually tradeable).
- **Bollinger Band squeeze:** the band-width is near its tightest level of the last ~6 months.
- **Early uptrend:** price above its 10-day average, 10-day average above the 30-day.
- **Volume pattern:** volume dried up (contraction), and is now picking back up (expansion).
- **Indicator vote:** at least 5 of 8 classic indicators must agree the setup is bullish — RSI, MACD, Momentum, Least-Squares MA, EMA, Ichimoku Cloud, VWAP, and Money Flow Index.

What you see

- **TRIGGERED** — every criterion confirmed, including the volume expansion. The strongest signal.
- **WATCH** — everything lines up except volume hasn't crossed the trigger yet (it's shown as a % of the way there).
- For each stock: current price, an ATR-based expected trading range, the 52-week range, indicator votes, dividend info, and the next earnings date (flagged when it's close).

Where and when

- Live dashboard: https://dhavalkodrani.github.io/Stock_squeeze_screener/ — no login or setup needed to view.
- Updates automatically every weekday after US market close (~5:30 pm ET).
- You can also type in your own list of tickers and get the same full analysis for just those stocks — including exactly why a stock does or doesn't qualify.

Disclaimer: This is an automated technical screen, not financial advice. The "expected range" is a mechanical projection based on historical volatility (ATR), not a forecast or guarantee. Stocks under \$2 are often thinly traded, volatile, and vulnerable to manipulation. Always verify data independently and do your own research before acting on anything this tool shows.
