

Stock Squeeze Screener

User Guide

1. Getting started

Open the dashboard at https://dhavalkodrani.github.io/Stock_squeeze_screener/ in any browser. Viewing results requires nothing — no account, no token, no install. The page always shows the most recent scan, with the date, time, and how long the scan took shown under the title.

2. What the screener looks for

The screener hunts for a specific technical setup called a **volume squeeze heading into an uptrend**. Every trading day it downloads a year of price history for ~4,000 US-listed stocks and keeps only those that pass ALL of these core filters:

- **Price filter:** under \$2.00 (and above \$0.05), with average daily dollar volume of at least \$100k.
- **Bollinger Band squeeze:** current band-width in the tightest 10% of the last 120 trading days. A tight squeeze means volatility has compressed — often the calm before a move.
- **Uptrend structure:** price above the 10-day moving average, and the 10-day above the 30-day.
- **Volume contraction then expansion:** volume dropped meaningfully at some point during the squeeze, and the latest day's volume is at least 1.15x the 20-day average (TRIGGERED) or getting close (WATCH).

Anything that survives is then put to an **8-indicator confirmation vote**, and needs at least 5 bullish votes:

- **RSI(14)** between 50 and 75 — bullish but not overbought
- **MACD(12/26/9)** line above its signal line
- **Momentum** — 10-day rate of change is positive
- **LSMA(25)** — price above a rising least-squares (linear regression) average
- **EMA(21)** — price above its exponential moving average
- **Ichimoku Cloud** — price trading above the cloud
- **VWAP(20)** — price above the rolling volume-weighted average price
- **Money Flow Index(14)** between 50 and 85 — money flowing in, not yet euphoric

3. Reading the results table

Column	What it means
Ticker	The stock symbol.
Status	TRIGGERED (green) = all criteria confirmed. WATCH (amber) = volume almost there. NO SETUP (gray) = analyzed on request but doesn't qualify (custom lists only).

Price	Latest closing price.
Expected Range (ATR)	A mechanical projection of the near-term trading range: price +/- 1.5x the 14-day Average True Range. Volatility math, not a prediction.
52-Wk Range	The stock's lowest and highest price over the past year.
Expansion	How close today's volume is to the breakout trigger. 100% = triggered.
Signals	Indicator votes passed, e.g. 6/8. Hover over it for the full breakdown with values.
Div / Earnings	Trailing-12-month dividend and yield (if the stock pays one), plus the next earnings report date. A yellow warning appears when earnings are within 14 days.
Notes	Plain-English explanation of the setup - or, for custom lists, exactly which criteria failed.

- **Sorting:** click any column header to sort by it; click again to reverse. The arrow shows the active sort. Default is alphabetical by ticker.
- **Threshold slider:** filters the main list by how close each stock is to its volume trigger. Drag it down to see more early-stage candidates, up to see only imminent ones.

4. Analyze My List — check your own tickers

Type any tickers into the "**Analyze specific tickers**" box, separated by commas (for example: MBOT, PLUG, SNDL), and click **Analyze My List**. In under a minute you get the same full analysis for exactly those stocks — and unlike the daily scan, **every ticker you asked about is shown**, even the ones that don't qualify, with notes explaining precisely which criteria failed (price filter, no squeeze, no uptrend, weak volume, or too few indicator votes). Up to 50 tickers per request. Custom analyses never overwrite the daily scan results — use the "back to full scan results" link to return.

Note: triggering an analysis requires a one-time token setup (next section). Just viewing results does not.

5. Refresh Now & the one-time token setup

The **Refresh Now** button starts a brand-new scan of the full universe on demand, and **Analyze My List** starts a scan of your custom tickers. Both actually run on GitHub's servers, so the page needs permission to start them on your behalf. That permission is a personal access token that YOU create, once:

- 1. Go to github.com/settings/tokens/new (sign in / create a free GitHub account if needed).
- 2. Give the token a name and an expiration date.
- 3. Tick the **repo** and **workflow** checkboxes. Generate the token and copy it.
- 4. On the dashboard, click the gear icon and paste the token into the box. Done.

The token is stored only in your own browser's local storage. It is never uploaded, committed, or shared with anyone — it goes straight from your browser to GitHub's API.

Security — treat your token like a password. Never share it, email it, screenshot it, or paste it into documents. Anyone who has it can act on your GitHub account. If a token ever leaks, revoke it immediately at github.com/settings/tokens and create a new one. Each person should create and use their own token.

While a scan runs, a live progress panel shows every ticker in the queue: **dim white** = not reached yet, **red** = being analyzed right now, **yellow** = checked, no setup, **green (larger)** = a hit. A counter tracks scanned vs. total.

6. The daily schedule & email reports

- The full scan runs automatically every weekday at 21:30 UTC (about 5:30 pm US Eastern, after market close). No one needs to do anything.
- The dashboard always shows the latest completed scan — the "Reload saved data" button re-fetches it without starting anything new.
- Optionally, the repository owner can configure SMTP secrets so TRIGGERED matches are also emailed as an HTML report. The dashboard works fully either way.

7. Frequently asked questions

Why is the list empty some days?

That's normal and honest — a genuine squeeze-into-breakout with 5+ indicator confirmations is rare. An empty list means nothing qualified today, not that the scan failed.

Why did a stock disappear from the list?

Every scan is a fresh snapshot. If a stock's squeeze broke down or volume faded, it simply no longer qualifies.

What does the "Expected Range" actually promise?

Nothing. It's the statistically typical near-term range given recent volatility (1.5x ATR). Stocks routinely move outside it.

Can I use this for stocks over \$2?

Yes — the Analyze My List box analyzes any US-listed ticker at any price. It will note that the price is outside the daily scan's filter, but all other analysis still applies.

Is my token safe?

It lives only in your browser. But it's still a credential: don't share it, and revoke it if in doubt.

Disclaimer: This is an automated technical screen, not financial advice. The "expected range" is a mechanical projection based on historical volatility (ATR), not a forecast or guarantee. Stocks under \$2 are often thinly traded, volatile, and vulnerable to manipulation. Always verify data independently and do your own research before acting on anything this tool shows.
